Objects AutoCAD is based on a 3-D, object-based coordinate system. Every object in the drawing can be named and manipulated. The objects are stored in a symbol table and the objects have a unique identifier (ID). The unique identifier identifies the object and its parts from other objects in the drawing. The symbol table stores information about each drawing element including: Name, coordinates, and visual properties such as color and texture. The symbol table is accessed using information in the object's properties. The object structure consists of a set of object properties. The object properties store a set of metadata about the object and can be stored in the drawing. Examples include: the name of the object, the color of the object, whether the object is active, and so on. The object information is stored in an object database. The object database stores the unique identifier, name, and coordinates for each object. The object database allows drawing and engineering groups to control access to the object information, allowing objects to be edited only by people in the relevant group. In AutoCAD, the element can be either an object or an element. An object is a macro that contains a set of elements and sub-elements. An element is the content of an object. As well as an ID and name, AutoCAD objects store properties that control the appearance and behavior of the object. Properties allow an object to be located in a scene as a static element, or an animation can be played at a specific time, or the object can be moved or rotated. Bounding boxes A bounding box is a shape that encloses a set of objects. A bounding box can be displayed by the mouse pointer and filled by the background color to indicate the objects it encloses. AutoCAD automatically determines a set of objects that may need to be drawn. The bounding box may be changed to show the area enclosing those objects. The bounding box is used by the object selection method to determine which objects are visible. The bounding box can be colored with any color of your choice to indicate the set of objects that it encloses. Objects AutoCAD has hundreds of standard objects. These include the following: Subparts Each AutoCAD object may have one or more subparts. A subpart is a hierarchy of objects that includes one or more other subparts. A subpart may have only one top-level subpart, or it a1d647c40b
