The ArcGIS API for AutoCAD allows users to automate ArcGIS map manipulation, service creation, and development with AutoLISP. It is a JavaScript interface library for AutoCAD which allows ArcGIS map and service manipulations to be executed automatically by AutoCAD. In AutoCAD, automation is often achieved by creating a macro, which allows you to build an application that runs a routine (sequence of commands). For example, you may want to build a routine that creates and saves a drawing. If you then use a keyboard shortcut (keyboard macro) to call your routine, it will happen automatically when you press the desired keyboard shortcut. However, in the more sophisticated AutoCAD 2012, AutoLISP macros can also be used to automate very complex tasks. For example, a macro can execute an AutoLISP routine that finds the "start point" of a long multilegged path, along which many primitives are created. Then, in another AutoLISP routine, the coordinates of the "end point" of that path are retrieved, and a spline path is automatically created. A collection of these routines could create a drawing from scratch, all without the need for any line of code, or any programming knowledge. [Sclerosing lipogranuloma of the oral cavity. Case report]. Sclerosing lipogranuloma (SL) is a rare benign lesion whose etiology and histogenesis remain unclear. The clinical features of SL are polymorphic: most lesions affect the upper extremities and face, and only a minority occur in the oral cavity. We report the case of a patient with SL of the hard palate.Fasten your seat belts and put on your helmets because here comes the car industry's first 24-inch tires. We've seen them before: special tires for 2-seater, robotaxi and other futuristic vehicles. But now, a car manufacturer is going even further with its vision of the future of driving. At the 2018 Frankfurt Motor Show, Daimler showcased its latest concept for the 22nd Century: the 2+2 luxury car that can transform into a flying taxi. The vehicle is actually not the first such concept car by Daimler, as it previously showed its Flugtisch (flying car) prototype in 2013. But this one is taking things to the next level. According to Daimler, the new concept car has a range of 6,000 kilometers and can reach a top speed of up to 180 kilometers per hour. Unlike other flying cars, Daimler's car can take off vertically from a flat surface, since it has 12 independent legs that can reach a height of five meters. With this, it allows it to navigate over wider areas. The steering wheel is in the center of the
