Kwatee Free Download allows users to deploy, update and manage software on Linux or Windows servers from the web or from an iPhone or Android device. How it works: Kwatee enables users to deploy as well as update software on the target servers. This can take place both on the LAN or in the Cloud. In brief terms, it is a push deployment utility that performs incremental updates on servers, all deployments being management from a single location. Kwatee encompasses several different roles that users will need to configure for the setup of Kwatee. As such, the Tomcat Process User and Tomcat Manager will have to be defined, along with the Database Administrator and the Kawatee Database user. Finally, the Default Administrator needs to be established (by default it uses the admin / password credentials). The installation process consists of deploying the WAR format file using the Tomcat Manager. Subsequently, the 'kawatee.properties' files will need to be edited to match users' specific needs. The documentation provides users with the default information for the integrated H2 database, but also for MySQL or PostgreSQL. Finally, users will need to reload Kwatee with the help of Tomcat Manager, opening the address in the web browser of choice. What is important to note, particularly for less experienced individuals is the fact that Kwatee provides step by step instructions in a heft online documentation. Moreover, it offers a video demonstration of how to work with it. Lifesize allows users to view, record, manage and share the lectures and the results in class. From there, students can access and edit video materials using a Google Chrome browser. They can work together and collaborate on the content while collaborating, editing, re-assigning roles, organizing meetings, setting up deadlines and much more. Lifesize will also work with different video sources: recorded lectures, library collections and all kinds of materials, including multimedia presentations, webinars and online courses. The features of Lifesize are: • Lectures and Class Management: the central point where students can access their lectures and other materials. Students can share their class material with other students (at the same or different universities) who have Lifesize. Students can also share their lectures with their teachers. • Video Sharing: a student can send a link to his classmates and vice-versa. This link will open directly the content in the Lifesize web. KnowledgeWare 2.2.0 Description: KnowledgeWare is an application that enables users to install software on machines in an automated manner. This software is delivered as a set of archives that include not only the necessary libraries and files for working with the system, but also all the required documentation for installing the applications onto the target machine. KnowledgeWare does not rely on any centralized server, such as Webmin or ModSecurity, but it offers the possibility to create work groups of computers that are scattered all over the place, where at any given time, only the files pertaining to a specific application need to be downloaded. The mechanism employed by KnowledgeWare for performing the aforementioned task is the fact that it will perform a rolling-update on the target machines, which means that the files are only downloaded onto the machines once they have been verified as having been installed. This is important to highlight as there is a possibility of these files being modified and thus being incompatible with the latest installation.
