I tried the following regedit key combinations without luck HKEY_CURRENT_USER\Software\Classes\Local Settings\Software\Microsoft\Windows\CurrentVersion\Run HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management When I try install the adobe update, it appears that the program has become the active process in the task manager, I'm trying to get the adobe update installed. A: I've solved the issue by upgrading to the latest windows 10 update. It's not advisable to use the 32 bit version because of the compatibility issues. The present invention relates generally to thermoelectric converters and more specifically to a thermoelectric module which allows for high temperature differentials between the hot and cold sides of a thermoelectric module. Thermoelectric converters are devices which utilize the coupling of temperature differences to produce electric power by a heat-to-electricity process and the reverse process. A solid state thermoelectric device consists of a thermal gradient between the hot and cold sides of the solid state material. The thermoelectric material couples the thermal gradient to electric potential via a Peltier effect. Current designs of thermoelectric generators and thermoelectric modules limit the ability of the thermoelectric material to perform effectively at higher temperatures, i.e., between about 650 and 800 degree. C., and also have a reduced efficiency at high temperatures. The efficiency of the device is defined as the ratio of the generated electric power to the power input to the device. In addition to efficiency considerations, there is another critical consideration in the design of a thermoelectric module; the temperature differential between the hot and cold sides of the module must be as high as possible. This would help to minimize the size and weight of the apparatus to which the thermoelectric module is connected. One type of thermal coupling mechanism includes a solid ceramic block, which is heated on one end and has a cold surface on the other end. However, the ceramic block blocks light and emits heat over a very broad spectrum of wavelengths. Another type of thermal coupling mechanism which has been used to couple thermal gradients includes a column of small bismuth telluride pellets. This type of thermal coupling relies on a solid phase change effect in a mass of materials, e.g., bismuth telluride
