Adobe Photoshop is a necessary piece of software which helps us in our everyday work; it is used for retouching images, creating websites, editing video clips, creating photorealistic images and much more. Adobe Photoshop can be downloaded for free using a serial key. To use Adobe Photoshop effectively, you need to understand some of the basic editing tools and features. The first feature that you should learn is the Curves tool. Adobe Photoshop uses the Curves tool to control the brightness, contrast, and saturation of your image. By using the tool, you can control the quality of your image. Other basic editing tools that you can use include the Dodge tool, where you can remove lighting imperfections, and the Burn tool, where you can remove imperfections from your photo, such as blemishes and camera noise. These are just a few of the basic editing tools that you can use in Adobe Photoshop. However, you should also learn some of the advanced editing tools, such as the Liquify tools and the Layer Styles tools.

The first thing you may notice is that the version numbers have been changed to 5. For whatever reason, Adobe decided to name their software products after digits. You can see it as a 6th version of Lightroom 4. Clearly, Lightroom 5 is not so different from Lightroom 4, but it tries to be a bit "advanced". That something new and improved has to be something very different doesn't make it bad – it may in fact be more like "Lightroom" Lightroom 4. I won't go into details, but chances are that Lightroom 5 will not disappoint. What is new is what Adobe calls the "Look" and "Discover" features, which I will later discuss in more detail in the "Pro" section. One thing I really like about these new features is how they help improve the sorting/grouping and browsing of photos. It can be done quickly and easily, and I know most photographers are probably not without sorting capabilities built into their camera or in some way image management software. The other thing I appreciate about Lightroom 5 is its performance. It has always been a very speedy application, not to mention that Photoshop has been at times even slower than a snail. In this case, the old standby might be the prize. Lightroom is now faster than Photoshop, but only by a very small margin. That is not to say Lightroom 5 doesn't have some serious problems, though. First of all, the new Features let you edit and catalog image information at a much higher level. You can, for example, add metadata for RAW or JPEG files and then save them to the location you want. Another great addition is the Import function, which allows you to organize images of different file types in one place and manage them better that way. One of the most important new features is the new "Create Look", which requires a relatively modern Intel processor and is compatible with Windows 7 or later. It is capable of creating a "group" from a series of photos, which will create a virtual "look" based on more than 20 settings. You can chose from nine presets, and it just works.
